Protect Your Patients with Patient Safe® Syringes

Catheter-associated bloodstream infections reported from hospitals across the United States have increased since the introduction of needleless devices.¹

According to the CDC, an estimated 250,000 catheter-related bloodstream infections occur in US hospitals each year.²

Catheter-related infections cost the US healthcare system $25,000 per episode.²

As many as 28,000 patients die each year in the US because of catheter-related bloodstream infections.³

For needlestick prevention, use VanishPoint® safety devices

Patient Safe® Syringe

The luer tip of a standard syringe is exposed, increasing the risk of contact contamination.

**DESIGNED FOR PATIENT AND CLINICIAN SAFETY**

- Unique luer guard promotes safe handling of syringe and medication.
- Reduces the risk of luer tip contact contamination and medication contamination.
- Reduces the risk of healthcare worker exposure to hazardous drugs during reconstitution, preparation, transport, and disposal.
- Compatible with most available hypodermic needles, including those with manually activated safety features, vial access devices, and luer-activated catheter hubs.

Patient Safe® syringes do not transfer contaminants to luer-activated valves or patients.

Standard syringes transfer contaminants to luer-activated valves and intravenous fluid.

**Patient Safe® syringes** are uniquely designed to reduce the risk of bloodstream infections resulting from catheter hub contamination.

Patient Safe® syringes promote aseptic technique and are easy to use.

Use Patient Safe® syringes as you would standard syringes.

Patient Safe® luer caps now available!
